Our Solar System Wikispaces

The principal component of the Solar System is the Sun, a G2 main-sequence star that contains 99.86% of the system's known mass and dominates it gravitationally. The Sun's four largest orbiting bodies, the giant planets , account for 99% of the remaining mass, with Jupiter and Saturn together comprising more than 90%.

Solar System - Wikipedia

10 Need-to-Know Things About the Solar System One of Billions. Our solar system is made up of a star, eight planets and countless smaller bodies such as dwarf... Meet Me in the Orion Arm. Our solar system orbits the center of the Milky Way Galaxy at about 515,000 mph (828,000 kph). A Long Way Round. ...

of empty space out there between the planets. Voyager 1, the most distant human-made object, has been in space for more than 40 years and it still has not escaped the influence of our Sun. As of Feb. 1, 2020, Voyager 1 is about 13.8 billion miles (22.2 billion kilometers) from the Sun — nearly four times the average distance from the Sun to icy Pluto.

How Big Is the Solar System? - NASA Solar System Exploration

From Wikipedia, the free encyclopedia
For the astronomical meaning (the sun and its planets etc), see Solar System.
Our Solar System is an album by the rock group Half Japanese, released in 1984 by Iridescence. It was reissued by Drag City in 2000.

Our Solar System - Wikipedia

The order of the planets in the solar system, starting nearest the sun and working outward is the following:
Mercury, Venus, Earth, Mars, Jupiter,

brightest, most massive and most complex ring system of any planet.

Overview | Planets - NASA Solar System Exploration

The Moon is Earth's only natural satellite and the fifth largest moon in the solar system. The Moon's presence helps stabilize our planet's wobble, which helps stabilize our climate. The Moon's distance from Earth is about 240,000 miles (385,000km). The Moon has a very thin atmosphere called an exosphere.

Overview | Earth's Moon - NASA Solar System Exploration

The sun at the center of this newly constructed solar system is about 5 feet (1.5 meters) wide. Mercury sits 224 feet (68 m) away from our star, while Venus, Earth and Mars lie 447 feet (120 m ...
