Process chemistry is the arm of pharmaceutical chemistry concerned with the development and optimization of a synthetic scheme and pilot plant procedure to manufacture compounds for the drug development phase.

### Process chemistry - Wikipedia

Ideally, each step of a synthesis route would be run using continuous processes and linked together, such that initial reagents are input at one end and API is isolated at the other. Even beyond that, the ultimate goal is to link continuous API manufacturing with continuous drug product production.

A few years ago, a study by a major pharmaceutical manufacturing company evaluated that about 50% of the reactions carried out in their synthesis would benefit from a continuous process; however 63% of those reaction could not been at that time performed in a microreactor, due to the presence of a solid. And that leads to the crucial point, the development of flexible and versatile microreactors capable of handling solids, to be used in multipurpose continuous plants.
